### 7.2 Intro to Probability

At the heart of probability theory is $\qquad$ . Rolling a die, flipping a coin, drawing a card and spinning a game board spinner are all examples of $\qquad$ . In a random process no individual event is predictable, even though the long range pattern of many individual events often is predictable.

|  | Is defined as the ratio of the.... |  |
| :--- | :--- | :--- |
| Probability |  |  |
|  |  |  |

Ranges from $\qquad$ to $\qquad$ .

| Types of Probability |  |
| :---: | :---: |
| Experimental |  |
| Theoretical |  |

## Calculating Probabilities

When calculating the probability of something happening, the "something" is called an $\qquad$ and the probability of the event happening is written $\qquad$ .

Ex. 1a) The probability of rolling a 3 on a die would be written $\qquad$ .

Ex. 1b) The probability of winning the lottery would be written $\qquad$ .

Probabilities are always expressed as $\qquad$ . The probability of an event that is certain to happen is $\qquad$ while the probability of an impossible event is $\qquad$ .

To calculate a probability, you count the $\qquad$ and divide this number by the total $\qquad$ .

Probability of an event: $P(E)=$

## Example of Theoretical Probability

Ex. 2) A bag contains 4 blue marbles, 6 green marbles and 3 yellow marbles. A marble is drawn at random from the bag.
a) What's the probability of drawing a green marble?
b) What's the probability of drawing a yellow marble?
c) What's the probability of drawing a green OR yellow marble?

## Example of Experimental Probability

Ex. 3) Suppose a study of car accidents and drivers who use mobile phones produced the following data:

|  | Had a car accident <br> in the last year | Did not have a car <br> accident <br> in the last year | Totals |
| :--- | :--- | :--- | :--- |
| Driver using mobile phone | 45 | 280 | 325 |
| Driver not using mobile phone | 25 | 405 | 430 |
| Totals | 70 | 685 | 755 |

This type of table is called a $\qquad$
The total number of people in the sample is $\qquad$ . The row totals are $\qquad$ and $\qquad$ .
The column totals are $\qquad$ and $\qquad$ . Notice that $325+430=$ $\qquad$ and $70+685=$ $\qquad$ .

Example. Calculate the following probabilities using the table above:
a) $\mathrm{P}($ a driver is a mobile phone user $)=$
b) $\mathrm{P}(\mathrm{a}$ driver had no accident in the last year $)=$
c) $P($ a driver using a mobile phone had no accident in the last year $)=$

Practice: Nine pieces of paper with the numbers $1,2,2,3,4,4,5,6$, and 6 printed on them are placed in a bag. A student chooses one without looking...
a) What is the probability of choosing a number 1 ?
b) What is the probability of choosing a number 4 ?
c) What is the probability of choosing an odd number?
d) What is the probability of choosing an odd number or a 6 ?

Practice. The following (incomplete) table shows a random sample of 100 hikers and the areas of hiking they prefer:

|  | Coastline | Near lakes <br> and streams | On mountain <br> peaks | Totals |
| :--- | ---: | :--- | :--- | :--- |
| Male | 18 | 16 |  | 45 |
| Female |  |  |  | 14 |
| $r$ Totals |  | 41 |  | 55 |

a) What is the probability that a hiker is a female?
b) What's the probability that a coastline hiker is a female?
c) What's the probability a male hiker prefers to hike on mountain peaks?
